Title : Of a System of Fertilization in Field Crop Rotations
On Leached Chernozem of the Central Chernozem Belt.

Orig Pub: Udobreniya i urozhay, 1956, No 11, 12-19.

Abstract: In the Shatilov Experimental station, three versions of a system of fertilization on leached chernozem in two 3-field crop rotations have been studied since 1940. A - bar fallow, winter wheat, clover with timothy grass (2 years), spring wheat, potato, vetch - oats on hay, winter rye, oats; B - bare fallow, winter wheat, potato, spring wheat, clover with timothy grass (2 years), winter rye,

Card : 1/4

buckwheat, oats. For rotation of each crop, rotation was applied with all of the following amounts of fertilizers per 1 ha.: in the I version - manure 20 t. and N35P30K30; on the II - manure 20 t. and N35P75K75; and on the III - manure 40 t. and N100P165K165. Without fertilizers, both crop rotations according to the aggregate harvest of rye, wheat, and oats did not differ among themselves, but the aggregate harvest of grain in crop rotation B was 22% higher at the expense of the additional field under buckwheat. On a layer of perennial grasses, in the conditions of the district, it is better to dispose winter crops, but not spring wheat. It is better to reseed perennial grasses on the spring crops. The total increase of the yield of all crops in crop

rotation, converting rye grain to starch equivalents in A and B, comprised (in C/hectare): in version I, 23.8, 30.4; in II, 28.2 and 37.2; in III, 45.7 and 50.6. In the 2nd rotation of the crop rotation, the augmentations of the yield were higher than in the 1st. The 20 ton/ha. quota of manure appears to be sufficient. Phosphorite flour, according to the data of the soil, fully replaces superphosphate, applied evenly. According to the results of experiments in 1953-1955, mixture of humus and powder-like superphosphate should be recommended for fertilization of rye on green fallows. Winter wheat and potato gave tangible increases of yields from organic-mineral mixture only on plots not fertilized or poorly fertilized

TITLE: Using gas scintillators for studying short x-ray pulses

SOURCE: Pribory* i tekhnika eksperimenta, no. 2, 1964, 116-119

TOPIC TAGS: x ray, x-ray pulse, scintillator, gas scintillator, pulsed x-ray tube

ABSTRACT: The possibility of using a gas scintillator for recording strong x-ray pulses was experimentally proved. A 50-cm-long, 20-cm-diameter argon-filled (at 0.01 torr) scintillator chamber had a 10-cm² beryllium window for x-rays and a 400-cm²plexiglas window for recording light-flashes by a photomultiplier. Argon luminescence vs. pressure, argon luminescence vs. filter thickness for W, Fe, and C x-ray-tube anodes, and conversion factor vs. radiated energy experimental curves are reported. For short-wave limits of 80, 54, and 27 kv of the continuous spectrum, the measured conversion factor was 0.16, 0.1, and 0.02 respectively.

TITLE: Effect of chemical structure upon the glass point of polycarbonates 7

SOURCE: Vysokomolekulyarnyye soyedineniya, v. 8, no. 1, 1966, 56-60

TOPIC TAGS: polycarbonate plastic, thermomechanical property

ABSTRACT: The effect of variations in the chemical composition of the monomeric unit in polycarbonates (I) (obtained by phosgenation of 4,4-dihydroxydiphenyl-alkanes) upon the glass point of the polymer has been investigated. The (I), prepared according to I. P. Losev, O. V. Smirnova, and Ye. V. Korcina (Vysokomolek. soyed., 5, 1491, 1963), were derived from monomers prepared by condensation of various aldehydes or ketones with: 1) phenol; 2) o- or m-cresol; 3) halogenated phenols. The glass point T_g was determined by means of thermomechanical testing of individual samples on dynamometric scales. It was established that: 1) increase in the length of aliphatic chains or introduction of methyl groups into the benzene

Card 1/2

UDC: 678.01:53+678.674

2

L 1843b-66

ACC NR: AP6003413

ring lowers the glass point; 2) insertion of an aromatic ring at the central carbon atom; 3) introduction of a central carbon atom into the saturated aliphatic cycle or of halogen into the benzene ring--all result in a rise of the glass point. The authors express their gratitude to O. V. Smirnova, Ye. V. Korovina, and El' Said Ali Khanan for polycarbonate samples. Orig. art. has: 1 table and 3 figures.

SOV/67-59-2-1/10

TITLE:

Use of Air Enriched With Oxygen in Partial Carbonization of Coal (Primeneniye obogashchennogo kislorodom vozdukh pri polukoksovaniyu ugliya)

PERIODICAL:

Kislorod, 1959, Nr 2, pp 1-9 (USSR)

ABSTRACT:

An air-blowing engine has hitherto been applied in multizone shaft furnaces, of which general use is made in partial carbonization of coal. In addition to semicoke, semicoke gas was produced which contained a large quantity of nitrogen. Thus this gas is very unfavorable for further use for heating and technical purposes. Consequently, the authors made an experiment with industrial furnaces in which they tried to use air enriched with oxygen. As a result, the semicoke gas was considerably improved and the coking process was intensified. A diagram of a multizone furnace for partial carbonization of coal is shown in figure 1, and its mechanism is

Card 1/3

Use of Air Enriched With Oxygen in Partial
Carbonization of Coal

SOV/67-59-2-1/18

described. For the purpose of investigating the dependence of the gas yield on temperature during the coking process the authors made laboratory experiments with Cheremkhovo coal. Data on the composition and yield of the gas are listed in table 1. The investigations were conducted by Engineer L. F. Ovsyanikov, with the assistance of Engineer V. N. Shiktorov, Engineer A. I. Gorokhova, and Engineer K. A. Bogens. In addition, the influence exercised by various oxygen contents on the composition and calorific value of the gas obtained was investigated. The following data were obtained: In addition to semicoke and tar, gas with a calorific value of 2,200 kcal/nm³ is obtained during the partial carbonization of coal in multizone shaft furnaces, using an air-oxygen blowing engine with an oxygen content of up to 30 and 35 %. A gas is produced by oxygen enrichment of 40 % which after further treatment can be used for synthesizing ammonia. With an enrichment of 50 % and more a gas results which has a calorific value of 4,000 kcal/nm³. Prime cost per calorie of the gas obtained does not differ greatly from that of

Card 2/3

Use of Air Enriched With Oxygen in Partial
Carbonization of Coal

SOV/67-59-2-1/18

natural gas (for conditions prevailing in East Siberia) (Table 4). The oxygen consumption does not exceed 40-50 % with respect to the amount required by direct gasification of coal by means of oxygen (producer gas) (Table 5). Table 2 and figures 3-7 (Diagrams) contain the technical characteristics of oxygen- and air consumption, composition, calorific value of the gas, furnace output, etc with various additions of oxygen. There are 7 figures, 4 tables, and 14 Soviet references.

TITLE: Planning operations in aviation headquarters

SOURCE: Aviatsiya i kosmonavtika, no. 11, 1966, 36-42

TOPIC TAGS: job analysis, ~~organization coordination, planning, operations research, PERT, economic planning, industrial management, air force organization~~

ABSTRACT: A method of preparing a functional plan of operations is described in detail. It is said that the flow diagrams and outlines currently being prepared by commanders and officers at aviation headquarters have certain shortcomings, such as poor estimation of the time required for each operation, lack of coordination between sections, and no visual means for timely detection and elimination of potential difficulties. Many of these problems can be eliminated by adapting methods of network planning and management (SPU), which are widely used in the national economy. In this case the planned process is broken down into individual tasks. Each task is performed in phases which are called events and are designated by the resultant term, such as "aircraft fueled," "decision made." Consequently, each event expresses some important moment in the realization of the planned action.

Card 1/2

ACC NR: AP6036171

Events are logically related to each other by means of tasks which actually transform one event into another. The task or operation means a working process which utilizes time and materials; "fictional work" means either a rest period or an enforced waiting period, which takes time but does not produce. On the basis of this terminology, flow charts of such planning are presented and methods of computation for determining the time allotment for each task are given. It is said that such graphic plans can be prepared well ahead of time not only for such stationary processes as actions during alert, preparation for second flight mission, retraining of a flight crew, etc, but also for such highly dynamic processes as the organization of activities during training under various circumstances. Experience with this type of planning should result in the preparation of standard plans which are periodically revised, and in the capability for estimating work capacity and anticipating difficulties in certain cases.

TITLE: Determination of the K fluorescence yields and K x-ray self-absorption coefficients for magnesium and aluminum [Report, Thirteenth Annual Conference on Nuclear Spectroscopy hold in Kiev 25 Jan to 2 Feb 1983]

SOURCE: V SSSR, Izvestiya Seriya fizicheskaya, v.28, no.1, 1964, 107-114

TOPIC TAGS: K fluorescence, x ray absorption, magnesium, aluminum

ABSTRACT: The results of measurements of the K fluorescence yield of different elements are used for constructing empirical yield curves; the curves plotted by different authors generally agree in the Z = 23 to 57 region, but in the regions of lower and higher atomic numbers the disparity between the curves based on different sets of data is appreciable. In the present work the K fluorescence yields from Mg and Al were determined with the aid of a 4 π counter by a method similar to that proposed by A.Compton (Phil.Mag.7,8,961, 1929) and by the method of absolute counting of K x-rays (A.A.Konstantinov, Pribory i tekhnika eksperimenta, No.1,67,1959). The Mg and Al were in the form of 1 to 3 mg/cm² thick foils with an area greater

Card 1/2

ACC.NR: AP4010303

than 5 cm². The primary (excitation) x-ray sources were the electron-capture isotopes Cr⁵¹ (ν_{51}) and Mn⁵⁴ (Cr⁵⁴). In addition to the K yields, there were determined the self-absorption coefficients for the K x-rays. The results obtained for the K fluorescence yields are $2.80 \pm 0.11\%$ for Mg and $3.81 \pm 0.15\%$ for Al, which are at variance with the data of earlier investigators and in rather poor agreement with the values found by empirical formulas: the empirical values given by J.Laberriquie-Frolov and P.Radvanyi (J.phys.et radium, 7, 944, 1956), which are the closest, are 2.0 and 2.8%, respectively. It is estimated that the error in determining the fluorescence yields in the present experiments does not exceed 4%. Orig.art.has: 13 formulas, 5 tables, and 4 figures.

Drying and storage of dried hot *kok-saghyz* roots. (I) II
 Neumann and M. S. Dreselius. *Konstab.*, 1941, No. 6, 20-2; *Chem. Zeitn.*, 1942, II, 1071. The roots of *kok-saghyz* can be dried in sunshine without
 resulting damage. The quality of the rubber is not im-
 paired by this method of drying, and the roots contain
 large quantities of hydrocarbons. Drying should reduce
 the moisture content to below 20%. If this is impossible,
 Antiseptics (chalk) should be added. During storage,
 there is a loss of hydrocarbons. When the rubber becomes
 moldy, its properties are impaired. C. C. Davis
